

My Carbon Footprint

Name: Md Iftekharul Islam

YOUR CARBON BREAKDOWN

How your footprint is measured and tips on how you can make improvements to reach the targets.

+ 3.06 TONNES GOVERNMENT EXPENDITURE

Reflection:

My carbon foot print is 75% which is very reasonable and less than the UK average although a little higher than world average. In the breakdown of carbon, house covers the maximum percentage (51%) for me as I use electric heater. The bigger amount is food which is 27% as I am not vegetarian; I eat both meat and fish with vegetables. The total annual carbon emission is 8 tones which is also within the target of 2020.

Your carbon footprint is **3 441 kg CO₂ per year**

Reflection:

In the calculation in the Finnish site of Ilmastodieetti.fi, I found that my carbon footprint is about 3500 kg carbon-di-oxide per year which is little different than the WWF,UK as the criteria are different. However, here, I found that I am emitting less carbon-di-oxide than average Finnish people and my footprint in terms of housing is highest and in terms of food and other consumption, it is also very reasonable. I am just about 3kg more in terms of waste compared with average Finnish people.
